Sperrin Environmental was set up as a subsidiary of Weld -Tech Engineering Service's, to identify and provide solutions for energy recovery and conservation. The main areas of expertise include the design and installation of heat exchangers and stack economisers, whereby the energy which is lost within a plant or process can be recovered thus fully utilising energy costs and maximising profits. These installations are suitable where heat waste water/liquids are dumped at a moderate to high temperature or where gas fired boilers are used to provide steam or hot water to a process.
